Brief Overview

The UK is, as far as we are aware, the only country in the world where e-cigarettes are comprehensively and effectively regulated at this time. The UK is currently the most forward-thinking and vape-friendly region in the world.

E-cigarettes are classified as consumer products in England, and are permitted to be used freely both indoors and outdoors in public places, except for in government buildings such as hospitals, schools, airports, etc (unless inside a designated smoking area).

England has a thriving vaping scene and retail stores can be found in abundance throughout most of the country.

England abides by the EU TPD, and as such, nicotine content of e-liquid must be less than or equal to 20mg/mL, single use e-cigarettes as well as e-cigarette tanks must not exceed 2mL, and volume of refill bottles must not exceed 10mL.

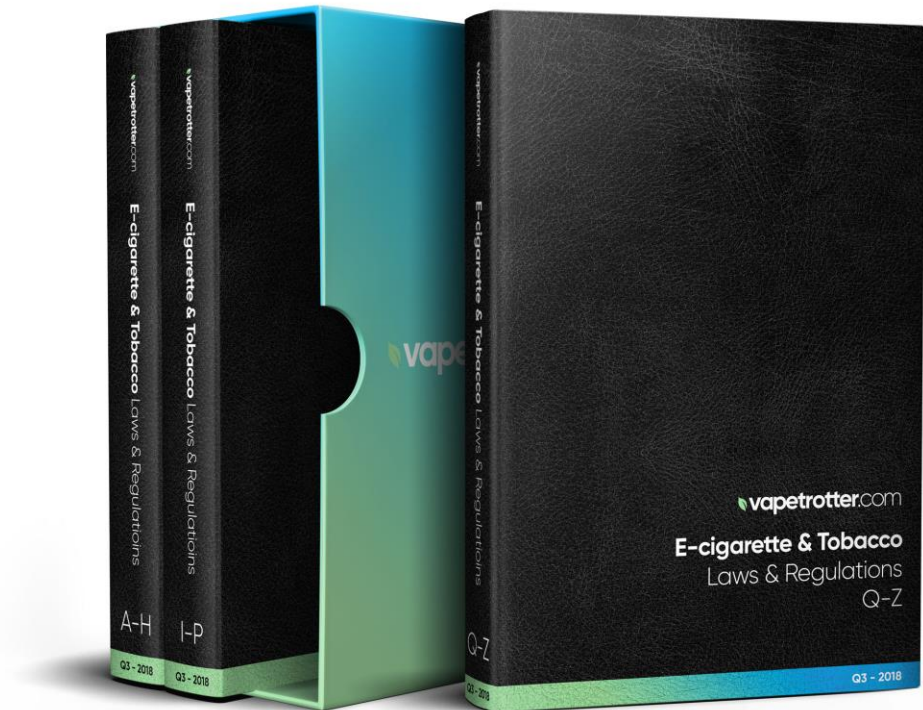

The UK aim to lower smoking rates to 12% by 2022, and with the upcoming Brexit there are reports that the UK will remove the EU TPD regulations to aid further in

[Pronunciation: /i:ˈlɪkwɪd/]

INTRODUCTION TO E-LIQUID

E-liquid is the fluid used in e-cigarettes. It is heated and evaporated into an inhalable vapor to provide nicotine, flavor, or both. E-liquid can be sold with or without nicotine depending on the legalities in the place of sale (or place of purchase) and also depending on the consumers needs.

E-liquids come in many variations, including different nicotine strengths and many different flavors (around 8000 on the market according to 2014 reports). The main ingredients are propylene glycol, vegetable glycerin, and flavorings; and most often, nicotine in liquid form. The liquid typically contains 80-95% propylene glycol and vegetable glycerin, and the remaining 5-20% being flavorings and nicotine. Among the most common ratios of vegetable glycerin and propylene glycol are 70-30 (VG-PG) and 80-20 (VG-PG). E-liquid containing vegetable glycerin and water or alcohol and made without propylene glycol are also sold.

Propylene Glycol (PG)

By [Angus McKay](#) | January 24, 2018

[f SHARE](#) [TWEET](#) [p SHARE](#) [g+ SHARE](#) [0 COMMENTS](#)

[« Back to Vapetrotter Wiki](#)

Pronunciation: /'prɒpɪli:n/'glɪkɒl/

Propylene glycol or PG is one of the base ingredients used in many [e-liquids](#). Higher PG content is associated increased [throat hit](#) and more intense [flavor](#) production as many commercially available flavors are PG based flavors. This is balanced by the fact that propylene glycol produces less [vapor](#) than [vegetable glycerin](#), making [flavor](#) and [throat hit](#) a trade off for [vapor](#) volume and thickness, this is why many [e-liquids](#) on the market today use 70% [vegetable glycerin](#) and 30% propylene glycol.

FURTHER INFORMATION ABOUT PROPYLENE GLYCOL IN GENERAL

Propylene glycol (IUPAC name: propane-1,2-diol) is a clear, colorless and hygroscopic synthetic organic compound with the chemical formula C₃H₈O₂. It is a viscous [liquid](#) which is nearly odorless but possesses a faintly sweet taste, though not as sweet as [vegetable glycerin](#). Chemically it is classed as a diol and is miscible with a broad range of solvents, including water, acetone, and chloroform which is why it has been used as a flavor carrier.
